Unpatched bug chain poses 'mass account takeover' threat to Yunmai weight monitoring app

Adam Bannister 06 June 2022 at 14:20 UTC

Updated: 06 June 2022 at 15:21 UTC

IoT Mobile Zero-day

User data related to at least 500,000 Android accounts at risk

<https://portswigger.net/daily-swig/unpatched-bug-chain-poses-mass-account-takeover-threat-to-yunmai-weight-monitoring-app>

MASS ACCOUNT TAKEOVER IN THE YUNMAI SMART SCALE API

“

The Android and iOS API were discovered to not implement any authorization checks while adding or deleting ‘family member’ accounts to/from other accounts.

”

Why is authorization so hard to get right?

Permission-based authorization on an API endpoint

```
1 @PreAuthorize("hasPermission('ADD_FAMILY_MEMBER')")
2 public void addMember(long familyId, FamilyMember member) {
3     familyData.addMember(familyId, member);
4 };
```

Question One:

Which OWASP API Top 10 issue have we solved with this permission check?

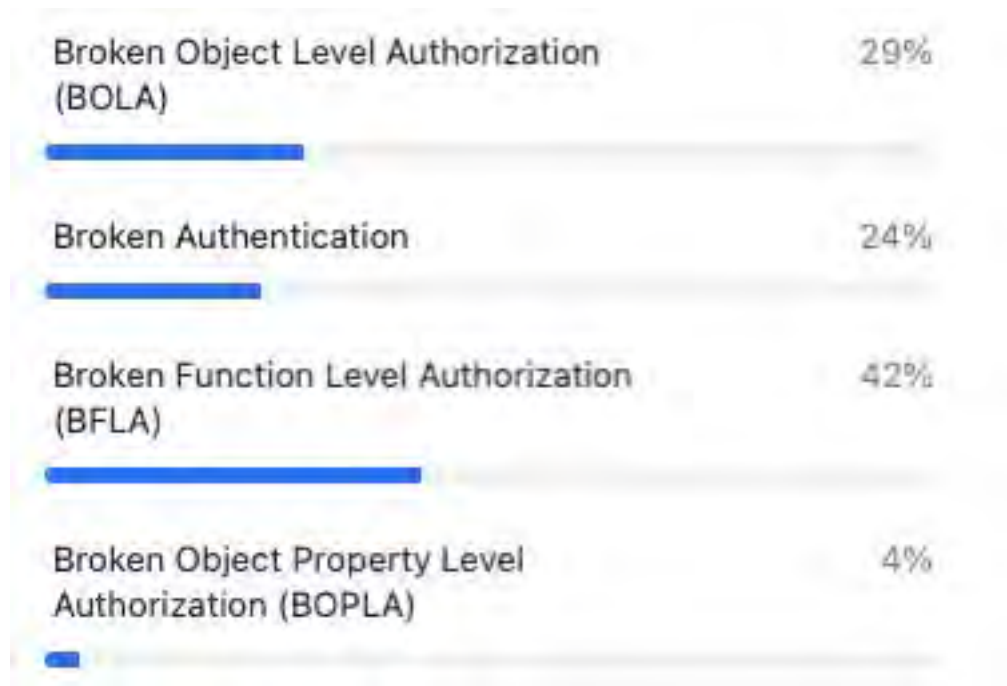

1. Broken Object Level Authorization (BOLA)?
2. Broken Authentication?
3. Broken Function Level Authorization (BFLA)?
4. Broken Object Property Level Authorization (BOPLA)?

Question One:

Which OWASP API Top 10 issue have we solved with this permission check?

An example of Broken Object-Level Authorization

```
1 @PreAuthorize("hasPermission('ADD_FAMILY_MEMBER')")
2 public void addMember(long familyId, FamilyMember member) {
3     familyData.addMember(familyId, member);
4 }
```

Adding a family member

```
1 POST /family/1/member HTTP/1.1
2 { name: ... }
```

**This adds a new member
to your family**

Adding a family member

```
1 POST /family/7/member HTTP/1.1
2 { name: ... }
```

**This adds a new member to
someone else's family**

**So we covered BFLA and BOLA,
but what about BOPLA?**

A young boy and girl are sitting at a desk with a laptop. The boy, on the left, has his arms raised in excitement and a wide, open-mouthed smile. He is wearing a dark blue t-shirt with a graphic that includes the word 'KAYAK'. The girl, on the right, is also smiling broadly with her mouth open. She is wearing a green and white striped shirt and has her right hand pointing towards the laptop screen. The background shows an office environment with a grey chair, a wooden desk, and a red exit sign on a door in the distance.

MASS ACCOUNT TAKEOVER IN THE YUNMAI SMART SCALE API

“

Account takeover through ‘forgot password’ functionality.

The victim will get an email with a unique 6 digit code that allows to reset the password.

”

Unrestricted access to brute-forceable 'forgot password' functionality is a critical security failure

An account enumeration vulnerability significantly amplifies authentication threats

How do you prevent brute force attacks?

A young boy and girl are sitting at a desk in an office-like setting. The boy, on the left, is wearing a dark blue t-shirt with a graphic that says 'KAYAK' and has his arms raised in the air with a wide, excited expression. The girl, on the right, is wearing a green and white striped t-shirt and is pointing towards a silver laptop on the desk with a similar excited expression. The background shows office cubicles and a red exit sign.

Abstract

JSON Web Token (JWT)

JSON Web Token (JWT) is a compact, URL-safe means of representing claims to be transferred between two parties. The claims in a JWT are encoded as a JSON object that is used as the payload of a JSON Web Signature (JWS) structure or as the plaintext of a JSON Web Encryption (JWE) structure, enabling the claims to be digitally signed or integrity protected with a Message Authentication Code (MAC) and/or encrypted.

JSON Web Token Best Current Practices

Abstract

JSON Web Tokens, also known as JWTs, are URL-safe JSON-based security tokens that contain a set of claims that can be signed and/or encrypted. JWTs are being widely used and deployed as a simple security token format in numerous protocols and applications, both in the area of digital identity and in other application areas. This Best Current Practices document updates [RFC 7519](#) to provide actionable guidance leading to secure implementation and deployment of JWTs.

How to Best Leverage JWTs for API Security

December 10, 2020

JSON Web tokens (JWTs) are used massively in API-based applications as access tokens or to transport information across services. Unfortunately, JWT standards are quite complex and it's very easy to get the implementation wrong. As a result, data breaches and API vulnerabilities due to poor JWT implementation, token leakage, and lack of proper validation remain widespread.

This webinar focuses on JWT best practices, most common JWT attacks and how the 42Crunch API Security Platform leverages OpenAPI (Swagger) Specification extensions to prevent them.

In this webinar you will learn:

- How to best use JWTs for API Security
- Most common attacks as illustrated in RFC 8725
- How 42Crunch can help you protect your APIs from those attacks

WEBINAR

Defending APIs with Jim Manico

November 10, 2022 | 9am PST | 5pm BST

Episode 1: Request Forgery on the Web - CSRF & SSRF

In this first episode Jim and Colin will discuss request forgery and how to prevent it. This technical talk is intended for the software developer who needs to build secure web applications and APIs. It will cover the two variants of request forgery — client-side (CSRF) and server-side (SSRF).

- CSRF is most widely associated with vulnerable web applications that trick a user in a client browser into submitting transactions they never intended to use in their current authenticated session. We will discuss historical CSRF attacks and investigate various well-proven defense strategies. **For API developers** we will investigate whether APIs are vulnerable to CSRF, and how to prevent it.
- SSRF attacks allow a malicious client to trick a vulnerable server into submitting requests to an unintended location, typically by submitting malformed URLs in payloads and relying on vulnerabilities in the URL parsing code. We will discuss prevention strategies and examine some well-known examples. **For API developers**, we will investigate ways in which SSRF can be directed at vulnerable APIs and examine a few recent API breaches and the latest research.

DEFENDING APIS WORKSHOP

London

April 18, 2024

World-renowned expert-led half-day practical workshop including:

- *Introduction to API Security*
- *Understand the OWASP API Top 10*
- *API Security Testing*
- *API Runtime Protection*
- *Latest vulnerabilities and much more*

Lunch & Drinks provided

Register: <https://42crunch.com/api-security-workshop-defending-apis/>

Audience Question One:

As organizations increasingly rely on microservices architectures, what new considerations arise for API security in distributed systems?

Audience Question Two:

Can BOLA and IDOR be considered the same or are there small differences?

Audience Question Three:

What part of a system should enforce the `additionalProperties` being set as false?

Audience Question Four:

Is there any automated tool you would recommend to test the API security in our organization?

Audience Question Five:

How does the architecture look with placing the firewall between the API gateway and the API?

THREE-PART WEBINAR SERIES

OWASP API Security TOP 10 Challenges – Episode 1

January 25, 2022

Watch the Webinar

Browse the Deck

In this 3-part webinar series Dr. Philippe De Ryck, Web Security Expert with Pragmatic Web Security and Colin Domoney of 42Crunch and APISecurity.io, take a deep dive into understanding and addressing the OWASP API Security Top 10 issues. Through detailed practical examples and use cases, they guide developers and security professionals through how to fix and secure their APIs in the face of these identified threats.

Episode 1: API security today and the OWASP API Top 10

In this first episode in the webinar series, Dr Philippe de Ryck and Colin Domoney discuss API security today and the challenges presented by the OWASP API security top 10. Questions from attendees were addressed throughout the webinar.

[View Episode 2: Address the OWASP API Authentication and Authorization Challenges.](#)

[View Episode 3: Remediating the outstanding OWASP API Security Top 10 Issues.](#)

Something Old, Something New – OWASP API Security Top 10 in 2023

August 1, 2023 | 9am PDT | 5pm BST

Watch the Webinar

Browse the Deck

The OWASP API Security project has recently updated its Top 10 list of vulnerabilities that are commonly found in APIs. This list includes both well-known issues and new ones that are currently affecting APIs in the real world. It is crucial for those involved in the API industry to stay informed about these top threats and the OWASP Top 10 list is an excellent resource for doing so. By staying up-to-date with the latest security challenges, API professionals can better protect their systems and ensure the safety of their users' data.

Join Colin Domoney (Chief Technology Evangelist) from 42Crunch as he takes a closer look at the 2023 Top 10, including:

- an overview of his research into API vulnerabilities of the last 12 months.
- the items dropping off the list and whether they are still a concern.
- the items remaining unchanged, and why they are more of a concern than ever.
- the three new items and why they warrant attention in 2023.
- we will also look at how 42Crunch can help you address these new items.

Join us to get the inside track on the new Top 10 concerns for API developers.
